6 Analysis of feedback circuits feedback signal has the same sign as the input, and adds to it (> 0 in). Such a circuit is said to have positive feedback. The feedback is positive when the product $A \cdot F$ (i.e. the G loop) is positive. Note that in circuits with positive feedback and G loop < 1 , the quantity $1 - G$ loop is positive but less than one.

If we add a little positive feedback to the comparator circuit, we will introduce hysteresis into the output. This hysteresis will cause the output to remain in its current state unless the AC input voltage undergoes a major change in magnitude. What this feedback resistor creates is a dual-reference for the comparator circuit.
