A given modulation scheme can result in the variation of one or more of these parameters. Before we look into the details of various linear modulation schemes, let us understand the need for modulation. Three basic blocks in any communication system are: 1) transmitter 2) Channel and 3) Receiver (Fig. 4.1).

Model consists of a sender, a message, a channel where the message travels, noise or interference and a receiver. 2. Communication Models and Theories. Often, communicators blame the audience for not accepting a message, but it is often that the sender, encoding process or channels chosen were not applied correctly.

Advantages of a linear model. A linear model of communication envisages a one-way process in which one party is the sender, encoding and transmitting the message, and another party is the recipient, receiving and decoding the information. Although this model is rather limited and has been superseded by two-way,...
